and all those who care for our legendary urban forest

a year in brief

MARCH 15, 2019. It is estimated that 13% of Rhode Island's forest trees were lost this year, having suffered multiple seasons of drought, gypsy moth infestation, and secondary opportunistic pests.

Locally, Aquidneck Island has been experiencing an issue unique to our large population of naturalized English oaks. *Quercus robur* is succumbing to the aggressive pathogen *Diplodia corticola* at an alarming rate. Over the past 12-month period, 158 public trees have been taken down by the city, the highest annual rate of removals seen over the past decade.

Despite the unusually heavy load of tree removals and hazard pruning, the city forestry crew managed to sustain their regular planting and maintenance

work, including installing a new grove of 30 native trees in Miantonomi Park with the Newport Tree Conservancy, Pell Elementary School students, and a generous private tree donor.

Dr. Michael Dirr continues to collaborate with the Conservancy on the preservation of multiple Newport heritage trees. Our student interns from The Newport Project at Rogers High School will be grafting heritage tree scions later this month in an attempt to produce viable clones of these very special trees.

The *America's Eden* research and publication project, dedicated to documenting Newport as a cultural landscape of national significance, has seen a year of extensive research completed. John Tschirch has now begun the work

of curating the rich array of paintings, photographs and garden plans gathered from archives near and far.

The Conservancy was pleased to welcome eleven new arboreta to Aquidneck Island in 2018, including New England's tiniest (in square footage), Walnut Point Arboretum. We also congratulate three Newport arboreta—The Whim, Bellevue House, and Broadlawns—for completing comprehensive historic landscape surveys, and we encourage others to follow in their footsteps.

And finally, over 100 species of very special specimen trees are now growing at The Tree House at Rogers High School. As the weather warms, please come pay them a visit! ■

INSIDE COVER PHOTO: North American tree expert Dr. Michael Dirr (with Newport Tree Conservancy volunteer Kate Brandeis, landscape designer Karen Barbera and Breezy) preps tree scions after a cold winter morning visiting Aquidneck Island heritage trees. A scion is a shoot or twig cut from a plant in order to clone the plant using grafting techniques.

Students from The Newport Project cheer each other on during Climbing Day with Bartlett Tree Experts and the Newport Tree Conservancy.

142 genera are documented in the citywide living collections

—Marion Oates Charles—

Newport Tree Conservancy President Lilly Dick and Evening of the Arboreta Guest of Honor Oatsie Charles, August 2018. Mrs. Charles was a true friend of the trees. Her iconic landscape, The Whim, was among the first private Newport landscapes accredited as an arboretum. Photo: Jen Carter.

HISTORIC LANDSCAPE SURVEYS OF NEWPORT ARBORETA

the whim

Three Newport accredited arboreta have recently undertaken historic landscape surveys. The **Newport Garden Club's Garden History and Design Committee**, working under the auspices of the Smithsonian's Archives of American Gardens project, documented The Whim and Bellevue House. Broadlawns's historic survey was completed by **PLACEstudio, LLC**. Visit the Heritage Landscape Directory at newporttreeconservancy.org to learn more. The Whim photo: Kate Whitney Lucey. meet new england's tiniest arboretum

In 1770, when surveyor Charles Blaskowitz mapped the city of Newport, the corner on which the Walnut Point Arboretum now stands marked the spot where the houses and shops of Newport's bustling Easton's Point neighborhood ended, and fields and woods began.

The historic Philip Caswell House was built on this site circa 1850, on what is now a .11-acre plot of land. Once the footprint of the house and backyard studio is taken into account, just .03 acres of open space remains. Here, on the paths and tiny gardens that surround their home, owners Maureen Cronin and Mark Marosits have created

New England's smallest "microarboretum," filled with over 40 species of trees and woody plants.

In 2018, with the assistance of the Newport Tree Conservancy, the Walnut Point Arboretum received its professional Level I accreditation from ArboNet, the international accrediting body for arboreta.

As Maureen and Mark worked on planning and planting their arboretum, they found that the unusually small scale of their project evoked a wide range of reactions, from incredulity to inquisitiveness.

"To be so small and to have done this invited conversations that just wouldn't

WALNUT POINT ARBORETUM COLLECTION HIGHLIGHTS

- ◆ Newport's only Medlar tree, *Mespilus germanica* 'Breda Giant,' a fruit tree cultivated since Roman times
- ◆ A dramatically columnar sugar maple, *Acer saccharum* 'Monumentale'
- ◆ **The Franklin Tree**, *Franklinia alamaha*, the only species in its elusive genus, not found in the wild since it was first collected along the banks of the Altamaha River in Georgia in 1765 by American botanists John and William Bertram
- ◆ Espaliered **Fuji & Mutsu apple trees**
- ◆ A striking semi-dwarf Japanese white pine, *Pinus parviflora* 'Tanima no yukim'

have happened if this was a large estate. It's been a kick to watch people move from skepticism to 'Wow, I could really do this too?'" explained Maureen.

Mark continued, "It's been an elegant way to learn about what it means to be an arboretum. It helped me switch from scale and square footage, to species. My a priori assumption was that an arboretum was defined by land alone. The fact that it was determined by variety....well, I'm never going to make my property bigger, but I can make the species diversity bigger."

When Mark and Maureen purchased the property, only one tree was standing—a *Cornus kousa* 'chinensis,' or Chinese dogwood, a species first brought out of China in 1908 by plant hunter Ernest Henry Wilson of the Arnold Arboretum in Boston. Today, the arboretum is home to an astounding array of unusual plants.

Mark explained that this diversity was largely driven by Maureen's passion and vision. "This has been a joy for me to watch unfold. This is so much more than a landscape plan... it's a celebration of diversity and engagement. Maureen has always been a person that embraced diversity of every type. Our arboretum is all about action verbs. We want people to engage with nature."

Mark and Maureen hope that their microarboretum will encourage visitors to embrace their own ambitious projects—especially those creative ventures that stem from the heart.

"There's an inner arboretum in everyone. The desire for self-expression, connection, for something a little bit bigger than ourselves...we just need to bring it to life." ■

america's eden

The Newport Tree Conservancy has been working with historian John Tschirch on a major research and publication project entitled *America's Eden: Newport Landscapes through the Ages*. With 300 pages of text illustrated with paintings, drawings and photographs, the book will be a major historical reference and a critical guide for future planning. We hope it will inspire the study, appreciation and preservation of Newport's historic landscapes, a critical element of the city's natural and cultural heritage.

Many works to be featured in the book were created by celebrated artists and photographers such as Frances Benjamin Johnston (*right*). But over the past year, John has had the pleasure of diving into archives of all shapes and sizes. To the left we glimpse a treasure trove unearthed at the offices of T.J. Brown Landscaping, Inc., which opened its doors in 1901.

LEFT Fruits of a day spent exploring the T.J. Brown Landscaping day books, including photographs of a 1933 Newport Horticultural Society clambake, a gargantuan tree being moved by horse and hand, and client records hearkening back to the company's establishment.

RIGHT: Frances Benjamin Johnston, *Gardeners at Beacon Hill House*, courtesy of the Library of Congress; photo circa 1920.

European hornbeam, *Carpinus betulus*, at Merrillton. The Conservancy is cloning this and other heritage trees via grafting with the help of Dr. Michael Dirr and student interns from The Newport Project at Rogers H.S.. Photo: Jon Greenberg.

American elm, *Ulmus americana*, at the former John Nicholas Brown estate. Due to Dutch elm disease, a beautiful mature specimen such as this is a rarity.

In preparation for grafting scions from heritage trees, Jy-Tique from The Newport Project practices his technique with *Metasequoia glyptostroboides* root stock.

684 species, subspecies, varieties and cultivars are documented in the citywide living collections
